

## **Penile Injections for Erectile Dysfunction**

### **Urology and Genito-Urinary Surgery**

CAVERJECT is indicated for the treatment of erectile dysfunction due to neurogenic, vasculogenic, psychogenic, or mixed etiology. It is also indicated as an adjunct in the diagnosis of erectile dysfunction.

CAVERJECT contains alprostadil, the naturally occurring form of prostaglandin E (PGE ), and normally induces an erection within 5 to 20 minutes, once the optimum dose has been established. The dose must be individualized for each patient by careful titration under physician supervision. (See DOSAGE AND ADMINISTRATION section of the enclosed prescribing information.)

Mild-to-moderate penile pain, generally well tolerated, was reported by about one third of patients in clinical trials. Among patients reporting studies, 11 % were pain related. CAVAERJECT is contraindicated in men with a known hypersensitivity to the drug or conditions that might predispose them to priapism, and in men with penile implants or anatomical deformities of the penis.

CAVERJECT is packed in convenient unit-of-use systems. Each system contains a vial of active drug, a prefilled syringe of bacteriostatic water, two alcohol pads, and illustrated patient instructions. The product is packaged in a self-locking, disposable case that will allow the patient or physician to safely dispose of the contents after administration. There are six unit-of-use systems included in each carton of CAVERJECT.
